Notes:

Our 7-Step Program is the most complete and will provide the best results.

Warm-season turf such as bermuda and zoysia are usually treated with different products compared to cool-season turf such as fescue.

During extreme periods of heat during summer, weeds may not be sprayed due to possible turf damage.

Rounds 1,2,& 7 are the only rounds which all program levels will receive. These are the most important rounds of the season.

Free service calls are provided only within 30 days of a previous treatment.

Summer fertilization has an organic component from 20%-40%.

We encourage 4-Step customers to apply their own fertilization during times we are not out in early summer and early fall to help turf stay dense and healthy.

Our best program, with 3 blanket weed-control treatments, 4 fertilizations, and with closer and consistent spacing between treatments.

Our lawncare programs will perform well, as long as homeowners and property managers help with proper irrigation and mowing.
